Perfect fit, maximum protection

It is important that your airbag fits perfectly in order to protect you as much as possible. A vest that is too tight could hurt you in the event of an explosion, on the other hand, a vest that is too loose might not be protective enough.

In the tables below you will find indications of measurements in cm relating to your bust, length shoulder to hip and your height. Once you have received the airbag, do the "hand test" by inserting it as in the photo. It is important to check that there is enough space for the 4 fingers. An optimal fit is important to ensure maximum airbag effectiveness.

A: chest size

B: length shoulder to hip

C: body height
